

FastClinic

User Guide — Run Your Multi-Specialty Clinic

Modern clinical care, made personal.

General practice · surgical specialties · dental · patient activation

Version 0.1.0 · 14 August 2026 · **fastclinic.dev**

Contents

The PDF page numbers and PowerPoint slide numbers are intentionally identical.

Component	Pages / slides	What it covers
Get started	3–6	Overview, sign-in, layout, and Copilot
Run the clinic	7–14	Treatments, appointments, patients, clinical, revenue, and billing
Keep patients in the loop	15–19	Recall, lapsed patients, follow-up, and measured outreach
Reach, automate & integrate	20–25	Communications, AI, web presence, API, and data operations
Compliance & interoperability	26–30	Current posture, GDPR path, FHIR/EHDS, and national adapters
Run it every week	31–33	Weekly operating rhythm and quick reference

SECTION 01

Get started

Orient the team around one operations cockpit, one consistent layout, and one assistant grounded in clinic data.

FastClinic at a glance

FastClinic is an open-source operations platform for European private multi-specialty clinics. The Overview is the daily scorecard: active and total patients, visits, revenue, service mix, and trends—all dated so the team knows how fresh the picture is.

The platform combines **real availability and conflict-safe appointments**, patient and contact-party operations, recall, communications, balanced billing, multi-specialty analytics, and an AI assistant. The public demo contains only synthetic records; it is designed for safe exploration rather than clinical use.

Sign in & the three-pane layout

Open <https://fastclinic.dev> and choose **Sign In**. Use the account method configured for your clinic; the public demo may offer local or Google sign-in.

- **Left** — navigation grouped by job: Overview, Operations, Recall & Scheduling, Communications, Help, and Admin.
- **Centre** — the active workspace: dashboards, lists, forms, and reports.
- **Right** — the collapsible **AI Copilot**, available without leaving the current task.

The public landing page, account flow, compliance page, developer page, app, chat, and dashboards support the same European language catalogue.

A screenshot of the FastClinic sign-in form. The form is white with rounded corners and a subtle shadow, centered on a light blue background. It features the FastClinic logo at the top, followed by a sub-header 'GP clinic activation cockpit. Sign in to continue.' Below this are two input fields: one for an email address (containing 'admin@fastclinic.example') and one for a password (containing the placeholder 'Password'). At the bottom of the form is a blue 'Sign in' button.

The AI Copilot — just ask

The Copilot turns plain-language questions into answers grounded in FastClinic's tools and current conversation. Ask *“Which specialties bring in the most revenue?”*, *“How many surgical cases did we run?”*, or *“Who is due for recall?”*

- Conversation history is checkpointed per account and thread, with bounded retention and context limits.
- The selected request language is propagated into agent tool execution so the answer and underlying labels stay aligned.
- Slash commands provide deterministic pulls: `/kpi`, `/due`, `/lapsed`, `/followup`, `/revenue`, and `/patient <id>`.

The assistant is scoped to operations and information retrieval; it is not a diagnostic or treatment-recommendation system.

The screenshot displays the FastClinic AI Assistant interface. On the left is a sidebar with navigation links: Overview, AI Assistant, Operations (Patients, Appointments, Treatments & Specialties, Clinical, Billing, Revenue), Recall & Scheduling (Recalls Due, Lapsed Patients, Post-Visit Follow-up, Recall Loop), Communications (SMS, Email, Web Presence), Help (Shortcuts, User Guide), and Admin (Data & Import). The main area shows a 'Clinic Overview' dashboard with key metrics: Active Patients (458), Total Patients (1,000), Visits (234), Revenue (€414,806), Lifetime Revenue (€7,344,572), and Clients (953). Below these are two charts: 'Visits per month' (a bar chart) and 'Revenue per month (€ incl VAT)' (a line chart). At the bottom left is a 'Revenue by category' horizontal bar chart, and at the bottom right is a 'Top services' table.

Service	Category	Times	Revenue
Dental implant	dental	140	€410,229
Orthodontic brace fitting	dental	152	€407,446
Total knee		10	€26,785

On the right side of the interface is the 'AI Assistant' chat window. It includes a 'New' button, a list of recent conversations, and a chat input area with a 'Send' button. The chat history shows a conversation about specialties bringing in the most revenue.

Message ID	Text	Time
#1852	Immunisation	2020-06-09
#1253	Repeat prescription	2020-06-30
#1842	Health check	2020-07-08
#1920	Health check	2020-07-18
#1303	Health check	2020-08-23
#1085	Health check	2020-09-02
#1167	Health check	2020-09-02
#1434	Health check	2020-09-16

SECTION 02

Run the clinic

Plan work, protect availability, understand the patient base, and keep the financial record balanced across every specialty.

Treatments & Specialties — the case-mix lens

Every treatment line is classified on two axes: **what was delivered** (consultation, surgery, dental, diagnostic, procedure, and more) and **which specialty delivered it**.

Use this view to compare revenue and case volume across general practice, orthopaedics, ophthalmology, ENT, general surgery, gynaecology, urology, dermatology, plastics, cardiology, gastroenterology, dental, and diagnostics. Surgical throughput and top procedures make the operational mix visible without flattening the clinic into a single revenue total.

Appointments & booking

Book into **real clinician availability**. Choose a clinician and date to see free and occupied slots, then create, confirm, reschedule, complete, or cancel an appointment.

- Conflict detection prevents the same clinician being double-booked.
- A parallel slot can remain available for another clinician.
- Booking changes retain operational history and can queue reminders.
- The integration API exposes availability and idempotent external reservation primitives for booking adapters.

The screenshot displays the FastClinic Appointments interface. The top navigation bar includes 'Fast Clinic', version '0.1.0', date '2026-06-11', a 'Chat' button, a 'FASTCLINIC' button, a user email 'admin@fastclinic.example', and a 'Logout' button. The left sidebar contains a menu with sections: OVERVIEW (Overview, AI Assistant), OPERATIONS (Patients, Appointments, Treatments & Specialties, Clinical, Billing, Revenue), RECALL & SCHEDULING (Recalls Due, Lapsed Patients, Post-Visit Follow-up, Recall Loop), COMMUNICATIONS (SMS, Email, Web Presence), HELP (Shortcuts, User Guide), and ADMIN (Data & Import). The main content area is titled 'Appointments' with the subtitle 'Book into real availability — no double-booking'. It features four summary cards: SCHEDULED (3), CONFIRMED (1), FREE SLOTS TODAY (17), and CANCELLED (0). Below these is a booking form for 'Clinician 101' on '06/10/2026'. The form includes fields for Patient ID (e.g., 1206), Time (09:20), Reason (e.g., Immunisation), and a 'Book' button. A 'Schedule — 2026-06-10' table shows the following appointments:

Time	Patient	Reason	Status	Confirm	Cancel
09:00	#1206	Orthopaedic consultation	confirmed		
09:20	— free —				
09:40	#1207	Cataract surgery pre-op	scheduled		
10:00	— free —				
10:20	#1208	Dental examination	scheduled		
10:40	— free —				
11:00	#1210	Post-operative review	scheduled		
11:20	— free —				
11:40	— free —				
12:00	— free —				
12:20	— free —				

The right sidebar contains an 'AI Assistant' section with a 'New' button and a text input field. Below it is a 'TRY ASKING:' section with three suggested questions: 'Which specialties bring in the most revenue?', 'How many surgical cases this month?', and 'Which patients are due for recall?'. A 'Send' button is located at the bottom of the AI Assistant section.

Patients, contacts & representatives

The searchable patient register shows visit count, last-seen date, and lifetime value. FastClinic deliberately separates the **subject of care** from the **contactable or billable party**.

That model supports a patient acting for themselves, a guardian representing a minor, a family contact, an emergency contact, or a separate payer. Consent, communications, and invoices are attributed to the correct party instead of assuming the patient is always directly contactable.

Patient profile

The profile brings together demographics, representatives, lifetime value, visit count, consultation history, diagnoses, notes, and recent billable items.

Use it before a call or visit to understand the relationship context as well as the care history. API mutations follow domain-safe behaviour: clinical subjects and notes are archived instead of silently erased, and linked parties cannot be deleted until their relationships are resolved.

Clinical operations

The Clinical view summarises common diagnoses and clinician activity across the practice. It is an operational workload and service-planning lens—not clinical decision support.

Use it to identify capacity pressure, recurring condition cohorts, and where follow-up programmes may be useful. Imported diagnoses and performed-care facts remain traceable to their synthetic consultations.

Revenue

Revenue is shown by month, service category, specialty, and top procedure. Pair it with Treatments & Specialties to understand both the money and the work behind it.

The analytics endpoints expose the same synthetic aggregates used by the dashboard, so an authorised integration can reconcile its reports against the user interface.

Billing & payments

Raise invoices from consultations, record part or full payments, issue refunds, and void invoices through reversing entries. A **balanced double-entry ledger** keeps every billed and collected amount accounted for.

Because payer and patient are separate, a guardian or insurer can pay for a subject of care naturally. API idempotency keys prevent the same payment being recorded twice, while the audit trail records operational mutations.

SECTION 03

Keep patients in the loop

Turn due care, lapsed relationships, and recent visits into reviewable, consent-aware outreach with measurable outcomes.

Recalls Due

Recalls Due surfaces who is due or overdue for recurring services such as immunisations, health checks, and repeat-prescription reviews. Rows are ranked by urgency and include a drafted message.

Intervals can account for age and cohort. Filters and CSV/XLS exports let the team review the cohort before queuing anything. No campaign is sent merely because a person appears in a list.

Lapsed Patients

Lapsed Patients finds people with no visit inside a chosen window and ranks them by lifetime value. Adjust the period to narrow or widen the cohort.

The view supports a deliberate win-back workflow: verify the relationship and contact channel, review the drafted message, respect purpose and opt-out rules, then measure whether outreach resulted in a return visit.

Post-Visit Follow-up

Post-Visit Follow-up lists recent visits—including post-procedure reviews—within a chosen 7, 14, 30, or 60-day window.

Use it for operational check-ins, recovery calls, review requests, or rebooking. Marketing and necessary clinical follow-up must be treated as distinct purposes; deployment policy determines the correct lawful basis and channel.

The Recall Loop — queue, send, measure

Queue reviewed cohorts as persistent reminders. Every communication attempt is logged as sent, failed, or blocked, and marketing opt-outs are enforced at the point of delivery.

The loop tracks pending work, delivery outcomes, blocked contacts, and the 30-day return rate. This provides an operational record of what the clinic did, not merely a static export of who appeared eligible.

Ask about patients, immunisations due, revenue — or tap a question below.

Ask a question or type /due /lapsed /hi **Send**

TRY ASKING:

- Which specialties bring in the most revenue?
- How many surgical cases this month?
- Which patients are due for recall?

⌘ Shortcuts for power users

SECTION 04

Reach, automate & integrate

Connect approved communication providers, use the assistant responsibly, expose typed APIs, and keep clinical and operational stores under control.

SMS & Email

Send through configured SMS and email providers after reviewing the recipient, purpose, and message. FastClinic suppresses opted-out marketing contacts at send time and retains immutable delivery outcomes.

Provider contracts, data location, processor terms, retention, and transfer controls remain deployment decisions. In environments without a configured provider, cohorts can still be exported for an approved clinic workflow.

AI Assistant

The full-page assistant supports deeper operational questions across revenue, scheduling, patients, and recall. Its agent tools are read-oriented and its evaluation suite checks grounding, tool routing, supported languages, privacy, prompt injection, safety, robustness, streaming, and memory.

Before real patient data is introduced, clinics must resolve the model provider, EU/EEA processing location, contracts, minimisation, retention, human oversight, and international-transfer position.

Web Presence

The audit suite checks how the clinic appears in search and AI answer engines, then writes dated reports for review. It complements patient retention with a top-of-funnel view of how prospective patients discover the clinic.

Keep published clinical claims, pricing, professional credentials, and privacy notices under human approval; the audit identifies issues but does not publish changes automatically.

Developer API

Surface	Location	Access model
Human guide	https://fastclinic.dev/developers	Public
Swagger UI	/api/docs	Public documentation
OpenAPI	/api/openapi.json and /swagger.json	Public schema
Clinical reads & analytics	/api/v1/...	Public synthetic reads
Clinical CRUD	Patients, parties, relationships, notes	Bearer token
Operations	Appointments, recall, communications, billing, audit	Bearer token

The API is typed and versioned. Destructive verbs use domain-safe semantics: archive, cancel, refund, or reverse rather than bypassing clinical and financial history. FastBooking uses a separate least-privilege token.

Data, import & database backends

The synthetic clinical model can run on **SQLite** or **PostgreSQL**. Production PostgreSQL data is isolated in the `fast_clinic` schema; operational state such as chat, appointments, reminders, billing, and audit records remains separately configured.

The migration verifies table counts, subject/party relationships, orphan checks, and the treatment-revenue checksum before commit. The public demo and repository continue to contain synthetic data only—no PHI.

Data & Import

Clinic records built from practice-management exports

Clinic data

Status: loaded · reference date 2026-06-10

Records	Count
Patients	1,000
Contacts	953
Consultations	9,779
Diagnoses	5,358
Clinical notes	3,918
Billed items	22,856

Refresh from export

Add a new practice-management export and refresh to update the clinic records.

Detected exports: synthetic_fastclinic.xlsx

Contacts for outbound campaigns

When an export includes contact names, phones and emails, campaign lists are ready for SMS/email. Without them, lists identify patients by reference only.

FastClinic · Modern clinical care, made personal

v0.1.0 · 2026-08-14 · fastclinic.dev · 25

SECTION 05

Compliance & interoperability

FastClinic's Europe-first design approach, current limitations, and potential FHIR/EHDS integration path. See fastclinic.dev/compliance for the full public statement.

Compliance posture — current vs planned

Available today

- Synthetic public demo and repository; no PHI.
- Separate subject-of-care and party/representative model.
- Consent-aware communications, mutation audit events, persistent conversation history, typed API, and balanced accounting.

Required before production health-data deployment

- Enforceable EU/EEA data residency, encryption and key management, fine-grained RBAC, MFA/SSO paths, append-only audit evidence, retention and legal holds.
- DPIA and processing records, processor agreements, incident procedures, backup/recovery evidence, and national legal review.

FastClinic does **not** currently claim ISO 27001/27701 certification, production EHR conformity, or automatic legal compliance for a deploying clinic.

GDPR integration approach

FastClinic is designed to give the clinic controller usable controls and the processor relationship auditable evidence.

Concern	Product / adapter approach
Privacy by design	Minimise data, isolate environments, apply least privilege and secure defaults
Lawful purpose	Keep health-care operations distinct from marketing consent and opt-out
Patient rights	Locate, explain, export, restrict, rectify, or erase where legally permitted
Representatives	Route minors and represented adults through the authorised party relationship
Retention	Country-configurable schedules and legal holds; erasure is not absolute for clinical records
Incidents	Structured logs and monitoring to support risk assessment and notification workflows
AI processing	Resolve provider location, contracts, transfers, minimisation, retention, and oversight first

Legal basis, national retention duties, controller responsibilities, and whether a DPO is required remain deployment-specific decisions.

FHIR R4 & EHDS integration approach

FastClinic keeps a **normalised internal core** and places FHIR profiles, national identifiers, terminology, transport, and consent rules in adapters.

FastClinic concept	Potential FHIR R4 boundary mapping
Subject of care	Patient
Guardian or contactable party	RelatedPerson / Patient.contact
Appointment and visit	Appointment / Encounter
Diagnosis and performed care	Condition / Procedure
Payer and coverage	Coverage / Organization
Clinician and clinic	Practitioner / PractitionerRole / Organization
Consent and audit evidence	Consent / AuditEvent

FHIR R4 is the planned interoperability spine; conformant FHIR import/export, EHDS exchange-format support, and production national connections are roadmap work—not capabilities claimed by the current synthetic demo.

National adapters & primary references

Potential adapters will materialise country-specific identifiers, profiles, terminology, professional identity, consent, and transport without contaminating the generic core.

Market	Discovery target	Primary reference
Estonia	TEHIK health information system / upTIS	TEHIK
Finland	Kanta FHIR transition and national profiles	Kanta
Germany	gematik ePA FHIR implementation guides	gematik
Netherlands	Nictiz profiles and MedMij trust framework	Nictiz / MedMij

Legislation and standards: [GDPR](#) · [EHDS Regulation](#) · [FHIR R4](#). Adapter conformance must be checked against the authoritative version in force for each deployment.

SECTION 06

Run it every week

A short, repeatable operating rhythm turns the dashboards into controlled action and measurable improvement.

The weekly playbook

1. **See.** Review Overview, Treatments & Specialties, and availability.
2. **Schedule.** Fill appropriate slots, confirm bookings, and resolve conflicts.
3. **Bill.** Raise invoices, record payments, and check the balanced trial balance.
4. **Recall.** Review due, lapsed, and follow-up cohorts before queuing reminders.
5. **Reach.** Confirm the party, purpose, consent state, and approved channel.
6. **Measure.** Track delivery outcomes, return rate, active patients, and revenue.
7. **Improve.** Review audit evidence, exceptions, and integration failures.

***The daily question:** How is the clinic running across every specialty—and what needs attention now?*

Quick reference

Need	Go to
Clinic scorecard	Overview
Case mix and procedures	Treatments & Specialties
Availability and booking	Appointments
Subject, party, and care history	Patients
Invoices, payments, and ledger	Billing
Due, lapsed, and recent-visit cohorts	Recall & Scheduling
Delivery status and return rate	Recall Loop
Operational questions	Copilot / AI Assistant
API schema and examples	fastclinic.dev/developers
Trust statement and roadmap	fastclinic.dev/compliance

Current public status: open-source operations cockpit, synthetic data only. Production controls, FHIR exchange, certifications, and national-system adapters must be implemented and verified before real health-data use.
